DOES AI THINK LIKE A HUMAN?

AI processes information very differently from humans. This card helps students distinguish between needing human understanding — feelings, memory, context — and needing pattern-matching: speed, data, repetition.

MAIN ACTIVITY

1. Read a situation card aloud (e.g. "a friend is crying — what do they need?").
2. Hunt for clues: does this need feelings, memory, context, tone (**Human Mind**) or patterns, speed, data-matching (**Pattern Machine**)?
3. Students decide and move to the Human Mind or Pattern Machine side of the room.
4. Discuss: could AI handle this situation? What would it miss?

MATERIALS

- 8–10 situation cards with short scenarios
- Two room labels: *Human Mind / Pattern Machine*

REFLECTION

- Can something sound smart without really understanding?
- Why does AI get confused by jokes, emotions, or sarcasm?
- When is pattern-matching enough, and when is it not?

REALITY CHECK

AI is fast at finding patterns — but it does not feel, remember, or understand.

That is a human superpower. AI can copy the shape of a thought; only people can actually have one.
