CAN AI MAKE MISTAKES?

Students often assume AI is always right because it answers quickly and confidently. This card shows that speed and confidence are not the same as accuracy — and that unclear information trips up both humans and AI.

MAIN ACTIVITY

1. Show 4–6 difficult images on screen or printed: blurry pictures, hidden objects, unusual angles, incomplete drawings.
2. Ask students to guess what each image shows. After each guess: "How sure are you? What made this easy or hard?"
3. Reveal the full image or correct answer.
4. Ask: "If this was hard for us, could it also be hard for AI? Why?"

MATERIALS

- 4–6 tricky images (blurry, cropped, unusual angles)
- A way to display them (projector, printouts, or tablet)

REFLECTION

- Which image was the hardest to identify?
- Did anyone feel sure but turn out to be wrong?
- Why might AI get confused in the same way?
- Should we always trust a fast, confident answer?

REALITY CHECK

A smart system can still be wrong when information is unclear.

AI predicts what is most likely — it does not *know*. Confidence is not proof. Good users check important facts.
