SHOULD YOU TRUST AI?

Can you always trust what AI says?

SHOULD YOU TRUST AI?

Children often think a smart-sounding answer must be true. This card teaches them that AI can sound confident even when it is wrong, incomplete, or only partly correct — and that good users always check.

MAIN ACTIVITY

1. Show three AI answers to the same simple question: one correct, one that sounds correct but is false, one clearly wrong.
2. Ask students to choose: *trust it*, *check it*, or *reject it*.
3. Discuss which answer sounded most convincing. What clues helped them decide?
4. Reveal the best answer and explain why the others were risky.

MATERIALS

- A printed sheet or slide with three AI-style answers
- Three signs or voting cards: *Trust*, *Check*, *Reject*

REFLECTION

- Does the most confident answer turn out to be the best one?
- What can you do when an AI answer sounds smart but you're not sure?
- Which topics should always be double-checked (health, safety, history, people)?

REALITY CHECK

AI predicts likely words — it does not automatically know what is true.

That's why AI can sound right and still be wrong. Good users verify important facts with a trusted source.
