SHOULD AI HELP YOU STUDY?

Where is the line between getting help and missing the point?

✓ SMART USE

1. Ask AI a question
2. Read & understand
3. Take notes in own words
4. Think, then close laptop

YOU LEARNED
Understanding = yours

VS

✗ NOT SO SMART

1. Get essay question

skip reading
skip thinking
skip understanding

2. Paste AI answer directly

YOU COPIED
Understanding = zero

PLACE | DEBATE | DRAW THE LINE

SHOULD AI HELP YOU STUDY?

Students need frameworks, not rules. The question is not "is AI allowed" but "when does using AI serve my learning and when does it replace it?" This card builds that judgment.

MAIN ACTIVITY

1. Present a spectrum on the board: LEFT = "Definitely okay" / RIGHT = "Definitely not okay." Read 10 study scenarios one at a time.
2. Students hold up a card (LEFT / MIDDLE / RIGHT) for each scenario. Scenarios include: asking AI to explain a concept you don't understand; asking AI to write your essay; using AI to check your grammar; asking AI for a second opinion on your argument.
3. Discuss disagreements. Where did people place the same scenario differently? Why? What are the underlying principles?
4. Class writes a shared "smart AI use" policy — for their own classroom. Post it on the wall.

MATERIALS

- Scenario cards (10 scenarios, printed)
- LEFT/MIDDLE/RIGHT voting cards (one set per student)
- Spectrum line on board or floor
- Shared policy template
- Large paper for wall display

REFLECTION

- What is the difference between using a tool and being replaced by one?
- When is struggling with a problem actually useful?
- What would you miss if AI did the thinking for you?
- Can you still call it your work?

REALITY CHECK

Using AI to understand something is different from using AI to avoid understanding it.

The second approach may produce better grades short-term but weaker thinking long-term. The skill gap doesn't disappear — it just gets delayed until a moment when AI is not available.
