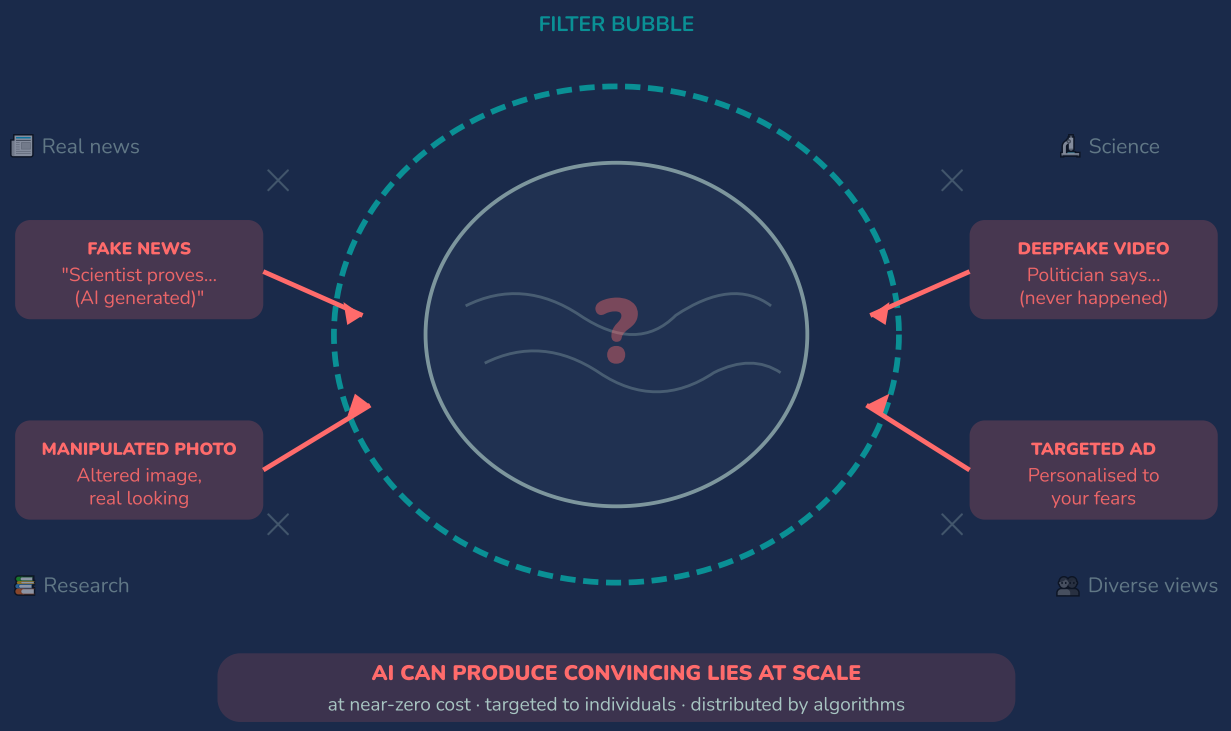
CAN AI CHANGE WHAT YOU BELIEVE?

How does AI-generated content shape what we think is true?



DETECT | ANALYSE | RESIST

CAN AI CHANGE WHAT YOU BELIEVE?

The goal is critical immunity, not paranoia. Students should leave understanding how persuasion works at scale and having concrete strategies for identifying manipulation — not simply fearing everything they see online.

MAIN ACTIVITY

1. Show three pieces of content: one obviously manipulative, one subtly misleading, one genuine. Students identify and explain their reasoning for each.
2. Introduce the concept of "AI-powered persuasion at scale" — content tailored to individual vulnerabilities, produced in volume, distributed algorithmically.
3. Groups analyse a case study: a real or simulated disinformation campaign. How was it designed? Who was targeted? What made it effective?
4. Students design an "inoculation card" — a pocket-sized guide to spotting AI-generated manipulation. Real, practical, personal.

MATERIALS

- Content samples (3 prepared examples)
- Case study sheet (real or simulated)
- Blank inoculation card template
- Disinformation analysis framework
- Gallery display space for final cards

REFLECTION

- Can you always tell when you are being manipulated?
- Who benefits from large-scale disinformation?
- What responsibilities do platforms have?
- How do you protect yourself without becoming cynical?

REALITY CHECK

AI can generate convincing content at near-zero cost.

The same technology used to make helpful chatbots can produce disinformation at industrial scale. The challenge is not just detecting fakes — it is maintaining trust when verification is increasingly difficult.
